Assignment BiocBot Feedback PDF Test	Submission attempt 1	Overall Strong draft
--	--------------------------------	--------------------------------

What worked well

Your explanation connects enzyme structure to catalytic function clearly. The progression from substrate binding to transition-state stabilization is easy to follow, and the example supports the central claim.

Suggestions for revision

Clarify how the proposed mutation changes the active-site microenvironment. Add one sentence distinguishing an effect on binding affinity from an effect on catalytic turnover, and support that distinction with the relevant kinetic parameter.

Recommended next step

Revise the final paragraph to compare the expected change in K_m with the expected change in k_{cat} . Then check that the conclusion answers the original question directly.
